

High Incidence of Initial Loss of Consciousness with Abnormal F-18 FDG and O-15 Water Brain PET in Patients with Chronic Closed Head Injury

Letters to Editor:

In reference to our previous publication in your journal titled: “High Incidence of Initial Loss of Consciousness with Abnormal F-18 FDG and O-15 Water Brain PET in Patients with Chronic Closed Head Injury” in the J Med Sci 2008;28(2):071-076, we would like to ask for correction for the mis-insertion of illustration labeled Figure 1. The correct image is included for consideration of an erratum. Thank you.

Prof. C. Oliver Wong, MD, PhD for all co-authors.

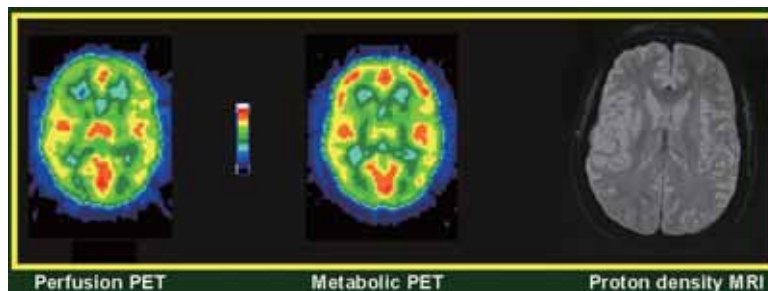

Fig. 1 A patient with closed head injury but without loss of consciousness has normal MRI and perfusion and metabolic PET (one color interval = one standard deviation with mean in the center of the scale).
